Early Battery Clock Parts & Restoration

## Eureka Clock Serial Number 9458.

*This is a tall movement with balance wheel showing below the solid enamelled dial. It has 2 balls with steel cover plates. The clock was found with large battery terminals added to the outside of the case for connection to unknown power source. The inside had a brass lamp holder next to the movement! Why I don't know. The case was in quite good condition other than the holes to secure the lamp holder and terminals. The holes were filled and the case French Polished. The glass was removed and cleaned before reassembly.*

*The original balance spring was completely unwound by a person or Force unknown. It looked as though 10000 volts had been shot through it. It was replaced by a new spring of 11.5 turns. The coil was in fine condition and read 20 ohms. The clock was completely stripped, cleaned and rebuilt. It now keeps good time and the wheel revolves with an amplitude of 360 degrees.*
